

Demo & Walkthrough Documentation

A clickable strawman prototype for a home-appliance repair workshop in Karachi — built to manage technicians, jobs, attendance, and the full carry-in repair lifecycle across a manager desktop view and a technician mobile view.

● Prototype v1.0

● 2 roles · 1 app

● 17 jobs · 5 technicians

● Mock data — no backend

Product	FixFlow — staff-only workforce & job management tool
Business	Home-appliance repair workshop — AC, washing machine, refrigerator, microwave
Location	Karachi, Pakistan · currency shown as Rs (PKR)
Purpose	Demo to the workshop manager to gather feedback before any real build
Demo date anchor	Saturday, 30 May 2026 (all aging & “today” logic is pinned to this date)

1 What FixFlow Is

The one-paragraph version, and what to keep in mind while demoing.

FixFlow is a single web app that runs a small repair workshop's day-to-day operations. It replaces the paper job-slips and WhatsApp back-and-forth with one shared view of every appliance in the shop: who brought it in, what's wrong, who's fixing it, what it will cost, whether the customer approved, and whether it has been paid for and collected. The same app also tracks technician attendance, payroll summaries, and a weekly work schedule, plus a built-in fault-code reference so technicians can diagnose common faults on the spot.

Important framing for the demo: this is a **strawman prototype**. Every screen is real and clickable, but all data is mock data that lives in the browser. There is no login, no server, and no real SMS or payment processing. Anything you change (create a job, log a payment) persists while the tab is open and resets on refresh. The goal is to react to a working shape of the product — “yes, but...”, “we’d also need...”, “this part is wrong for us” — not to use it for real work yet.

The problem today

Job status lives in people's heads and on paper slips. Nobody can see at a glance what's ready for pickup, what's stuck waiting for a part, or who is overloaded.

What FixFlow gives

One board of every job with a clear status, a guided repair workflow from intake to payment, and a live dashboard of what needs attention right now.

Who uses it

The **manager** runs the shop from a desktop. **Technicians** work from their phones — built for quick taps with greasy hands and big touch targets.

2 Two Roles, One App

There is no login. A toggle in the header switches between the two experiences — handy for demoing both on one laptop.

Manager

Desktop / tablet · left sidebar navigation

The shop overview. Sees every job, every technician, attendance, the weekly schedule, and shop settings. Creates jobs, sets and approves estimates, marks jobs ready, logs payments, and closes them.

Navigation: fixed left sidebar with 7 sections; wide multi-column layouts and data tables.

Technician

Mobile · bottom tab bar · shown in a phone frame on desktop

The personal work view. Sees only the jobs assigned to that technician, clocks in/out for attendance, looks up fault codes, and checks their week and pay summary.

Navigation: 4 bottom tabs (My Jobs · Clock In · Diagnose · Profile), built with ≥44px tap targets.

3 Information Architecture

Every screen in the app. The URL prefix decides the role: anything under `/tech` is the technician phone view; everything else is the manager desktop view.

★ The **Jobs** module is the heart of the product and the deepest screen — build the demo around it.

4 The Core: Job Lifecycle

Every appliance moves through the same path from intake to collection. This is the single most important flow to show in a demo.

Branches off the happy path

Two status systems work together. The **job status** (Open → Waiting → Ready → Closed) is what everyone sees on the board. Inside a job, the **estimate** has its own state — none → estimated → approved / declined — and the **payment** tracks owed / paid with a method of cash, card, or pending. Every action writes a timestamped line to the job's **timeline**.

5 The End-to-End Demo Script

The one flow to walk live. Take a carry-in repair from creation all the way to closed. Suggested talking points are in green.

1 Start on the Dashboard, switch to Manager view

Point out the four KPI cards and the “Needs Attention” alerts — jobs awaiting pickup, estimates awaiting approval, absent technicians.

“This is what the manager sees first thing in the morning — the whole shop in one screen.”

2 Open the Jobs board → click “New Job”

Fill in a carry-in: customer name & phone, appliance type/brand, the problem, and assign a technician. Save.

“A walk-in just dropped off a microwave — here’s how it enters the system. It gets the next token automatically.”

3 Open the new job → add a diagnosis note

Use “Add Note” to record what the technician found. It appears in the notes list and on the timeline.

“The technician inspected it and logged the fault — everything is recorded against this one job.”

4 Set the estimate

Add a part (e.g. turntable motor at **Rs 3,500**) and labour hours (1 hr × **Rs 1,200**). The grand total computes live.

“Parts plus labour gives the customer quote — **Rs 4,700**. The job is now “Estimated”, awaiting approval.”

5 Mark the estimate Approved

Simulates the customer agreeing to the quote. The action bar now offers “Mark Ready”.

“Customer approved over the phone — now the technician can do the repair.”

6 Mark Ready → watch the SMS toast

Status flips to **Ready** and a toast confirms “SMS notification sent to customer”.

“The moment it’s fixed, the customer is automatically texted to come collect it. (In the real build this hits an SMS gateway.)”

7 Log the payment

Amount defaults to the balance owed; choose Cash or Card. Balance drops to zero.

“Customer collects and pays — recorded here, so the day’s revenue is accurate.”

8 Close the job

The job moves to the **History** tab, and the full timeline tells the whole story start to finish.

“Done. And it’s all auditable — who did what, when, for how much.”

6 Screen-by-Screen Walkthrough

What each screen is for and what to highlight. Manager screens first, then the technician phone screens.

Manager

SCREEN	WHAT IT DOES & WHAT TO POINT OUT
Dashboard /	Four live KPI cards (Present Today, Active Jobs, Awaiting Parts, Revenue This Week), a Needs Attention alert strip that links straight to the affected jobs, and a Recent Activity feed pulled from every job's timeline.
Jobs board ★ /jobs	Tabs for All / Open / Waiting / Ready / History, plus search. Each card shows the token, status chip, customer, appliance, a problem snippet, the assigned technician, and the amount (or "Pending estimate"). "New Job" opens the intake form.
Job detail ★ /jobs/:id	The deepest screen. Customer + appliance header, Problem & Diagnosis (notes, photo placeholders), the itemised Estimate, Payment (owed / paid / balance), the Timeline, and a sticky action bar whose buttons change with the job's state.
Technicians /technicians	Card grid of the 5 staff — avatar, specialty, today's presence, active job count, tap-to-call. Click through to a full profile.
Technician detail /technicians/:id	Attendance dot-calendar, performance numbers, current jobs, and a 3-month payroll table . Carries dashed badges for the (mock) Attendance and Payroll services.
Attendance /attendance	Today's table (clock-in, clock-out, hours) and a colour-coded monthly grid of every technician × every day.
Schedule /schedule	Weekly grid (technicians × Mon–Sat) with job mini-cards; home visits are blue with a time window; today's column is highlighted.
Troubleshooting /troubleshooting	Searchable fault-code reference (13 codes) with meaning, likely causes, recommended part and cost range, plus a Common Fixes accordion. "Add to Job" drops a part straight onto an open job's estimate.
Settings /settings	Workshop profile (name, location, labour rate, working days) and the list of integration points the real system would connect to.

Technician (phone)

SCREEN	WHAT IT DOES & WHAT TO POINT OUT
My Jobs /tech/jobs	Only the jobs assigned to the logged-in technician, with big tap targets and Active / Ready / All filters.
Clock In /tech/clock	One large Clock In / Clock Out button, "clocked in since...", and the technician's own monthly attendance dots.
Diagnose /tech/troubleshoot	The same fault-code reference in a compact, phone-friendly layout for use at the bench.
Profile /tech/profile	Identity + tap-to-call, quick stats, and the latest month's pay summary.

My Week

</tech/schedule>

A vertical day-by-day list of the technician’s scheduled jobs, with today highlighted. Opens from the top-bar calendar icon.

7 Design Language

Clean, industrial-utilitarian. White cards on a light slate background, strong type, no gradients or illustrations — colour carries the meaning.

Status colours (used everywhere — board, chips, timeline dots)

- Open — newly received, in progress
- Waiting — blocked on part or approval
- Ready — repaired, awaiting pickup
- Closed — paid & collected (history)
- Danger — declined / abandoned / absent

Typography & layout

- **Plus Jakarta Sans** throughout — distinct, not the usual Inter/Arial.
- Bold, glanceable tokens and status labels; 14–16px body text.
- Manager = wide multi-column tables & grids. Technician = single-column, thumb-friendly.
- Responsive: below 768px the manager sidebar collapses into a drawer.

Integration badges

Where the real system would talk to an outside service, the prototype shows a **dashed, muted badge with a link icon**. These are deliberately non-functional markers, so it's obvious what is real UI versus a future hookup.

 Synced with Attendance Service

 Linked to Parts Supplier

8 What's Loaded in the Demo

The numbers the manager will see are driven by this seed data, pinned to 30 May 2026.

Dashboard at a glance

PRESENT TODAY

4/5

on duty (1 absent)

ACTIVE JOBS

13

open · waiting · ready

AWAITING PARTS

2

blocked on supplier

REVENUE THIS WEEK

Rs 5,100

payments collected

17 jobs (tokens #1035–#1051)

STATUS	COUNT	NOTES
● Open	6	incl. 2 home visits today
● Waiting	4	2 for parts, 2 for approval
● Ready	3	aged 1, 4 & 9 days
● Closed	4	full payment history

5 technicians

NAME	SPECIALTY	TODAY
Imran Ahmed	AC Specialist	Present
Kashif Raza	General Repair	Present
Tariq Mehmood	Washing Machine	Absent
Asif Ali	Refrigeration	Present
Bilal Khan	General Repair	On Field

Also seeded: a **13-code fault reference** (5 AC · 5 washing machine · 3 refrigerator) with common-fix guides for 4 appliance types, a full month of **attendance** records, and the current **week's schedule** (Mon–Sat, incl. home visits).

9 Integrations & How It's Built

The prototype marks — but does not connect — the four places a production build would integrate with outside systems.

Attendance

Biometric / clock device feeding the attendance grid.

Payroll

Salary system behind the pay tables & deductions.

SMS Gateway

Sends the "your repair is ready" text on Mark Ready.

Parts Supplier

Live parts catalogue & pricing for estimates.

Architecture (how the prototype is assembled)

10 Scope & Caveats

Set expectations up front so feedback lands on the right things.

✓ In this prototype

- Every screen for both roles, fully clickable
- The complete carry-in repair workflow, end to end
- Live KPIs, alerts, and activity feed
- Attendance, schedule, payroll views & fault-code reference
- Realistic Karachi pricing in Rs

✗ Deliberately out of scope

- No login / user accounts / permissions
- No server or database — data resets on refresh
- No real SMS, payments, or supplier catalogue
- No customer-facing portal, GPS/maps, or charts
- No drag-and-drop scheduling (view only)

Best questions to ask the manager during the demo: Does the job board match how you actually track repairs? Are these the right statuses? What's missing from a job — warranty, customer history, photos that matter? Is the estimate/approval step how you really quote customers? Which of the four integrations matters most first?
